

AI reinvention made real

Accenture Innovation Challenge 2026

Team details

TEAM NAME: Dunhill

**Rahul Kumar
Meena**

College:IIT KANPUR
Stream: Civil Engineering
Year of graduation:2027

**Harshvardhan
Singh Shekhawat**

College:IIT KANPUR
Stream: Mechanical Engineering
Year of graduation:2027

**Pranay
Saini**

College:IIT KANPUR
Stream: Civil Engineering
Year of graduation:2027

THE CURRENT BUSINESS INTELLIGENCE PROCESS

Modern organizations generate large amounts of information across sales, finance, marketing, operations, customer support, and supply chain systems. However, when an important KPI changes, decision makers are still dependent on analysts to manually connect information across these sources before they can understand what happened.

A dashboard may show that revenue declined by 8%, but it rarely explains the underlying reasons or recommends the most appropriate response.

WHY BUSINESS DECISIONS GET DELAYED

- Numbers Without Context:** Dashboards show the movement of a metric but rarely connect it with the operational or customer events occurring around it.
- Information Across Silos:** The evidence required to explain a KPI is distributed across financial records, customer feedback, operational reports, and market information.
- Manual Root-Cause Investigation:** Analysts must compare multiple sources and investigate several possible explanations before reaching a conclusion.
- No Clear Path From Insight to Action:** Even after identifying a likely cause, the final recommendation still depends on human interpretation and discussion.

FROM DASHBOARDS TO DECISIONS

- Traditional BI: Reports What Happened**
StoryLens AI: Explains what happened and why.
- Traditional BI: Requires Manual Investigation**
StoryLens AI: Automatically investigates multiple sources.
- Traditional BI: Presents Isolated Metrics**
StoryLens AI: Connects metrics with business events.
- Traditional BI: Leaves Action To The Analyst**
StoryLens AI: Recommends evidence-based next steps.

THE STORYLENS AI CONCEPT

An intelligent business investigation engine designed to convert KPI changes into evidence-based business stories and recommended actions.

KPI Change → AI Investigation → Evidence → Likely Causes → Business Story → Recommended Action

HOW STORYLENS AI INVESTIGATES BUSINESS EVENTS

UNDERSTANDING THE INVESTIGATION PROCESS

Traditional business analysis often requires analysts to manually collect evidence from multiple systems before they can explain a change in performance. StoryLens AI automates this investigation by continuously gathering information, validating business signals, examining possible explanations, and transforming analytical findings into actionable narratives.

CORE INVESTIGATION PRINCIPLES

- Business Context:** A metric should never be analyzed in isolation. The surrounding operational, financial, and customer events must be examined together.
- Information Integration:** Evidence should be collected from every available business source rather than from a single dashboard.
- Multiple Possibilities:** Several explanations should be investigated simultaneously before conclusions are reached.
- Transparent Reasoning:** Every finding should be supported by evidence that decision makers can review and verify.
- Human Oversight:** When evidence is insufficient, the system should request additional investigation instead of forcing a conclusion.

HOW STORYLENS AI HANDLES UNCERTAINTY

Business events rarely have a single cause. StoryLens AI evaluates several possibilities and communicates the relative strength of each explanation. This approach prevents uncertainty from being presented as certainty.

WHAT MAKES STORYLENS AI DIFFERENT

- Evidence-based explanations:** Every conclusion is supported by verifiable evidence.
- Investigation instead of reporting:** The system actively searches for relationships between events rather than simply displaying metrics.
- Clear business narratives:** Findings are translated into language that executives can immediately understand.
- Action-oriented insights:** Every investigation concludes with practical recommendations.

FOUNDATIONAL ASSUMPTIONS

- Existing business systems remain unchanged:** The solution works with existing organizational data.
- Decision makers remain in control:** The system recommends actions but does not make final business decisions.
- Continuous learning:** Previous investigations can be referenced when similar business events occur in the future.

SCENARIO	StoryLens AI investigates a business event in three stages, and each stage produces a decision-ready output on its own. Financial, customer, operational, and market data are drawn together automatically — no analyst has to chase the numbers by hand.					
	STEP 1	STEP 2		STEP 3		
	<u>Evidence Collection</u> Financial, customer, and operational records are pulled together automatically. Revenue is down 8%, complaints up 24%, and shipment delays up 18%.	<u>Pattern Correlation</u> Operational and market signals are cross-checked against customer behavior. Delivery disruptions line up almost exactly with the drop in repeat purchases.		<u>Narrative Generation</u> The evidence is combined into one plain-language business story, with a confidence score and a recommended set of actions attached.		
FINDINGS	<u>PRIMARY DRIVER — SUPPLIER PERFORMANCE</u> Shipment delays rose 18% and cut product availability, directly affecting the customer experience. This is the strongest single explanation the evidence supports, at 84% confidence.	<u>CUSTOMER IMPACT WAS DIRECT</u> Complaints rose 24% and satisfaction fell as deliveries slipped. Fewer repeat purchases followed, and that decline in retention shows up directly in revenue.		<u>OPERATIONS AND CUSTOMERS ARE LINKED</u> The investigation shows operational disruption and customer behavior moving together, not as two separate problems — which is why fixing one side alone won't be enough.		
ACTIONS	IMMEDIATE RESPONSE		SHORT-TERM RESPONSE		LONG-TERM RESPONSE	
	<u>What we recommend</u> Prioritize delayed orders, resolve pending customer deliveries, and improve customer communication. <u>Why it matters</u> Fast resolution stops complaint escalation and rebuilds trust with the customers already affected. <u>Pilot target</u> Clear the high-priority delivery backlog within two weeks of rollout.		<u>What we recommend</u> Review supplier performance, strengthen inventory monitoring, and identify process bottlenecks. <u>Why it matters</u> Fixing the operational root cause is what stops the delays and complaints from coming back. <u>Pilot target</u> Bring the 18% shipment-delay rate down to a single digit within one quarter.		<u>What we recommend</u> Develop alternative supplier relationships, increase supply chain flexibility, and monitor continuously. <u>Why it matters</u> A diversified, continuously-watched supply chain protects revenue the next time disruption hits. <u>Pilot target</u> No repeat of a supplier-driven revenue decline of this size within four quarters.	

Thank you
